# ESAWEIGHT V10.0 (2025.02.11)

## WHAT'S NEW

### GENERAL

- **Database Access**  
The database access protocol has been updated. This allows for better interaction with current technologies and improved access times. Furthermore, it now enables the option to ensure a state-of-the-art encryption of communication between ESA software and database systems.
- **Interfaces**  
The Protection of access information used by system interfaces, as well as authentication-related data, has been improved.
- **Root Directory**  
The root directory has been restructured to allow for easier and more granular access control.
- **Default User**  
In all standard modules, either a user must be logged in or a default user must be configured. Backend modules must run with a dedicated user. This increases both security and the quality of generated data.

### MANAGER

- **Modernization of the User Interface**  
To further simplify daily operations in the ESAweight Manager, we have carried out a comprehensive update of the development tools and can now offer the ESAweight Manager as a multi-view system. This concept provides improved support for multi-monitor setups. Additionally, we took the opportunity to enhance the visual appearance of the Manager.
- **Standardization of Filter Options**  
The previously available filtering options have been standardized, revised, and expanded.
- **Inventory Details – Flat View**  
To improve clarity, the "Inventory Details" view is now displayed with a flatter hierarchy.
- **Stack as of - Performance**  
Thanks to a revision of the calculation algorithm, larger data volumes can now be processed more quickly here.
- **Parallel Opening of Master Data**  
While master data is being edited, it is locked from being edited by another user in parallel. However, the affected data can still be viewed in read-only mode.
